Geek Survival 101

1. How to change the default browser in Linux

How to change the default browser Linux

For solving this problem, you have to change the ***mimeapps.list*** stored in *** cg~/.config/*** gc, so that all the previous default browser its substituted with the new one.

Also, it is important to change the ***~/.profile*** file, so the environment variable ***$BROWSER*** stores the new default one, and if you are using ***i3***, you should change the browser shortcut.
